DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-4 and 6-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campion (US 6,201,917) in view of Ishikawa (US 5,895,515) and Aikawa (US 5,995,695).

Regarding claims 1, 2, 8 and 9, Campion discloses a single mode optical fiber comprising a light-conductive core portion (20), an internal cladding portion (22) surrounding this core portion and a jacketing portion (25). Campion lacks reference to the claimed refractive index relationship. Campion further lacks reference to doping with fluorine. Ishikawa discloses the refractive index of the core portion is larger than the refractive index of the cladding portion and jacketing portion (Fig. 16). Ishikawa further discloses the refractive indices of the cladding and the jacket being practically equal (Fig. 16). Aikawa teaches the doping of silica glass with 0.4 % by weight fluorine (col. 9 lines 35-36). It would have been obvious to a person of ordinary skill in the art at the time the invention was made to create the Campion invention with the refractive index relationship taught by Ishikawa for the purpose of creating a higher level of reflectivity between the core material and the cladding and jacket layers. It would further have been obvious to dope the cladding layer with fluorine for the purpose of lower the refractive index of the material to create more reflectivity between the cladding and the core material.

Art Unit: 2872

Regarding claims 3 and 10, Campion discloses a buffer layer (26) between a jacketing portion (25) and the internal cladding (22). Campion lacks the claimed refractive index relationship. Ishikawa teaches the claimed relationship between the refractive indices of the core material and the surrounding layers of material (Fig. 16). It would have been obvious to a person of ordinary skill in the art at the time the invention was made to create the Campion invention with the refractive index relationship taught by Ishikawa for the purpose of creating a higher level of reflectivity between the core material and the surrounding layers.

Regarding claims 4 and 11, Campion discloses an intermediate layer (21) between a core (20) and the internal cladding (22). Campion lacks the claimed refractive index relationship.

Ishikawa teaches the claimed relationship between the refractive indices of the core material and the surrounding layers of material (Fig. 16). It would have been obvious to a person of ordinary skill in the art at the time the invention was made to create the Campion invention with the refractive index relationship taught by Ishikawa for the purpose of creating a higher level of reflectivity between the core material and the surrounding layers.

Regarding claim 6, Campion teaches the diameter of the core material to be 50 μm and the diameter of the core material plus the internal cladding to be 90 μm . Therefore the thickness of the cladding layer in the Campion reference is 20 μm .

Regarding claim 7, Campion teaches the process of creating an optical fiber by building up (col. 4 lines 65-67). Campion lacks reference to doping the material with fluorine. Aikawa teaches the use of doping silica with 0.4 % by weight fluorine. It would have been obvious to a person of ordinary skill in the art at the time the invention was made to use the creation process

Art Unit: 2872

taught by Campion with the doping material taught by Aikawa for the purpose of manipulating the refractive index.

Claims 5 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campion in view of Ishikawa and Aikawa as applied to claims 1 and 8 above, and further in view of Unger (US 4,691,991).

Campion in combination with Ishikawa and Aikawa teaches the invention as claimed but lacks reference to an external cladding layer outside the jacketing layer. Unger teaches the use of an external cladding layer (18) surrounding the jacketing layer (16), which is next to the internal cladding layer (14). It would have been obvious to a person of ordinary skill in the art at the time the invention was made to create the Campion in combination with Ishikawa and Aikawa invention with the external cladding layer taught by Unger for the purpose of creating a higher level of reflectivity between the core material and the surrounding layers and eliminating longer wavelength transmissions down the fiber.

Claims 13 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campion in view of Ishikawa and Aikawa as applied to claim 8 above, and further in view of Bachman (US 4,468,413).

Campion in combination with Ishikawa and Aikawa teaches the invention as claimed but lack reference to the use PCVD and plasma induction. Bachman teaches the use of PCVD to form the layers of the optical fiber (col. 1 line 67 – col. 2 line 7). Bachman further teaches the use of plasma activation in the doping of the optical fiber (col. 1 lines 48-57). It would have

Art Unit: 2872

been obvious to a person of ordinary skill in the art at the time the invention was made to create

the layers of the Campion in combination with Ishikawa and Aikawa invention using PCVD as

taught by Bachman for the purpose of efficiently creating the and doping an optical fiber at low

pressure.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's

disclosure.

Shimongaichi (US 6,020,224) teaches the use of PCVD and plasma in creating an optical

fiber.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Joshua L Pritchett whose telephone number is 703-305-7917.

The examiner can normally be reached on Monday - Friday 7:00 - 3:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Cassandra Spyrou can be reached on 703-308-1687. The fax phone numbers for the

organization where this application or proceeding is assigned are 703-872-9318 for regular

communications and 703-872-9319 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding

should be directed to the receptionist whose telephone number is 703-308-0956.
